                                                                                                                                       catalyzing the formation of riboflavin from 5-amino-6.(1'-b).
ribityl-amino-2,4(1H.3H)-pyrimidinedione and L-3,4-dihydrohy-2-butanone-4-phosphate of,7-dimethyl-8-lumazine. The beta subunit catalyzes the condensation of 5-amino-6.(1'-b)-ribityl-amino-2,4(1H.3H)-pyrimidinedione with L-3,4-dihydrohy-2-butanone-4-phosphate yielding 6,7-dimethyl-8-lumazine (By similarity).
-!- CATALYTIC ACTIVITY: 2 6,7-dimethyl-8-lumazine (By similarity).
-!- PATHWAY: Riboflavin biosynthesis; last step.
-!- PATHWAY: Riboflavin biosynthesis; last step.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                "Nucleotide sequence of a gene cluster involved in entry of E colicins and single-stranded DNA of infecting filamentous bacteriophages into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SEQUENCE FROM N.A.

I. FUNCTION: Riboflavin synthase is a bifunctional enzyme complex

acatalyzating the formation of riboflavin from S-amino-6 (1-D)-

ribityl-amino-2 4 (1H.3H) *Pprimidiaedione and L-3 4-dihydrohy-2-

butanone-4 phosphate via 6,7-dimethyl-8-lumazine. The beta subunit

catalyzes the condensation of S-amino-6 (1-D)-ribityl-lumazine =

riboflavin + 4-(1-D-ribitylamio) -S-amino-2,6-dihydroxypyrimidine.

2.4 (1H.3H) *Pyrimidiaedione with L.3.4-dihydrohy-2-butanone-4-

phosphate yielding 6,7-dimethyl-8-lumazine (By similarity).

I. PATHWAY: Riboflavin biosynthesis; last step.

I. PATHWAY: Riboflavin biosynthesis; last step.

I. SIMILARITY: Belongs to the DMEL synthase family.

-1- FUNCTION: Riboflavin synthase is a bifunctional enzyme complex catalyzing the formation of riboflavin from 5-amino-6-(1'-D)-ribityl-amino-2,4(1H,3H)-pyrimidinedione and L.3,4-dihydrohy-2-butanone-4-phosphate via 6,7-dimethyl-8-lumazine. The beta subunit catalyzes the condensation of 5-amino-6-(1'-D)-ribityl-amino-2,4(1H,3H)-pyrimidinedione with L.3,4-dihydrohy-2-butanone-4-phosphate yielding 6,7-dimethyl-8-lumazine (By

                                                                                                                                                                        -1- FUNCTION: Destroys radicals which are normally produced within the cells and which are toxic to biological systems.
-1- CATALYTIC ACTIVITY: 2 superoxide + 2 H(+) = O(2) + H(2)O(2).
-1- COFACTOR: Binds 1 copper ion and 1 zinc ion per subunit.
                                                                                                MEDLINE-89290032; PubMed-2500367;

1- FUNCTION: Riboflavin synthase is a bifunctional enzyme complex catalyzing the formation of riboflavin from S-amino-6-(1.-D).

ribityl-amino-2.4 (1H.3H)-pyrimidinedione and L-3, 4-dihydrohy-2-butanone-4-phosphate via 6,7-dimethyl-8-lumazine. The beta subunit catalyzes the condensation of S-amino-6-(1.-D)-ribityl-amino-2,4 (1H.3H)-pyrimidinedione with L-3,4-dihydrohy-2-butanone-4-phosphate yielding 6,7-dimethyl-8-lumazine (By
                                                                                                                                                                                                                                                                                                                                                     similarity)
-!-CATALYTIC ACTIVITY: 2 6,7-dimethyl-8-(1-D-ribityl)lumazine =
    riboflavin + 4-(1-D-ribitylamino)-5-amino-2,6-dihydroxypyrimidine.
-!- PATHWAY: Riboflavin blosynthesis; last step.
-!- SIMILARITY: Belongs to the DWRL synthase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SECUENCE FROM N.A. DNA Res. 8:123-140(2001).

-!- FUNCTION: Riboflavin synthase is a bifunctional enzyme complex catalyzing the formation of riboflavin from 5-amino-6.(1'-D).

ribityl-amino-2,4(1H,3H)-pyrimidinedione and L-3,4-dinydrohy-2-butanone-4-phosphate via 6,7-dimethyl-8-lumazine. The beta subunit catalyzes the condensation of 5-amino-6-(1'-D) -ribityl-amino-2,4(1H,3H)-pyrimidinedione with L-3,4-dihydrohy-2-butanone-4-phosphate yielding 6,7-dimethyl-8-lumazine (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -1- CATALYTIC ACTIVITY: 2 6,7-dimethyl-8-(1-D-ribityl)lumazine = riboflavin + 4-(1-D-ribitylamino)-5-amino-2,6-dihydroxypyrimidine-
-1- PATHWAY: Riboflavin biosynthesis; last step.
-1- SIMILARITY: Belongs to the DWRL synthase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             STRAIN=JCM 10545 / 7;

"Complete genome sequence of the marine planctomycete Pirellula sp.
Brrain I., i,
Brrain I., Acad. Sci. U.S.A. 100:8298-8303(2003).
-!- FUNCTION: This protein is essential for replication of the Chromosome. It is also involved in DNA recombination and repair (By similarity).
-!- SIMILARITY: Contains 1 SSB domain.
                                                                                                                                                                                                                                                                                                                          P59932; Q7UKV3;

"Multiple gene duplication and expression of mouse bcl-2-related
genes, Al.";
Int. Immunol. 10:631-637(1998).

"Int. Immunol. 10:631-637(1998).

"Int. Immunol. In the response of hemopoietic cells to external signals
function in the response of hemopoietic cells to external signals
and in maintaining endothelial survival during infection.

"SUBCELLULAR LOCATION: Intracellular.

"INDICATION: By granulocyte-macrophage colony-stimulating factor
and LPS in macrophages.

"INDICATION: By granulocyte-macrophage colony-stimulating factor
and LPS in macrophages.

"INDICATION: By Blongs to the Bcl-2 femily.

"INDILARITY: Belongs to the Bcl-2 femily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

-i- TISSUE SPECIFICITY: Seems to be restricted to the hematopoietic compartment. Expressed in peripheral blood, spleen, and bone marrow, at moderate levels in lung, small intestine and testis, at a minimal levels in other tissues. Also found in vascular smooth muscle cells and hematopoietic malignancies.
-i- INDUCTION: By phorbol ester and inflammatory cytokines, such as TNF-alpha, or IL-1-beta, but not by growth factors.
-i- SIMILARITY: Contains 1 Bcl-2 homology 1 (BH1) domain.
-i- SIMILARITY: Belongs to the Bcl-2 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     "Differences in the regulation of messenger RNA for housekeeping and specialized-cell ferritin. A comparison of three distinct ferritin complementary DNAs, the corresponding subunits, and identification of

"Crystal atructure of builifrog M ferritin at 2.8 A resolution:
"Crystal structure of builifrog mid-resolution at analysis of subunit interactions and the binuclear metal center.";
J. Biol. Inorg. Chem. 4:243-256(1999)
-!- FUNCTION: Ferritin is an intracellular molecule that stores iron in a soluble, nontoxic, readily available form. The functional molecule, which is composed of 24 chains, is roughly spherical and contains a central cavity into which the polymeric ferric iron
                                                                                                                                                                                                                                                     core is deposited.
-!- MISCELLANEOUS: THERE ARE THREE TYPES OF FERRITIN SUBUNITS: L, M
AND H CHAINS IN AMPHIBIA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

Johnson L., Nguyen D., Wang J., Forst C., Hood L.,

The complete genome sequence of Haemophius ducreyi.";

Submitted (JUN-2003) to the EMBL/Genbank/DBJ databases.

I. Submitted (JUN-2013) to the EMBL/Genbank/DBJ databases.

C. - FUNCTION: Catalyzes a salvage reaction resulting in the formation

of AMP, that is energically less costly than de novo synthesis.

C. - CATALYTIC ACTIVITY: AMP + diphosphate = adenine + 5-phospho-alpha-

D-ribose 1-diphosphate.

C. - SUBGNIT: Homodimer (By similarity).

- SUBGRILUIAR IOCATION: Cytoplasmic.

- SUBCELLUIAR LOCATION: Cytoplasmic.

- SUMILARITY: Belongs to the purine/pyrimidine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This SWISS-PROT entry is copyright. By prokaryotic dnaA sequence in Drosophila melanogaster: Wolbachia infection and cytoplasmic incompatibility among laboratory strains.";

Insect Mol. Biol. 3:131-142(1994).

-!- FUNCTION: Dlays an important role in the initiation and regulation of chromosomal replication. Binds to the origin of replication; it binds specifically double-stranded DNA at a 9 bp consensus (dnaA box); 5'-TTATC(C/A)A(C/A)A-3'. DnaA binds to ATP and to acidic

Struct. Biol. 6:691-696(1999).
-!- FUNCTION: CAN BFFICIENTLY HYDROLYZE NONSTANDARD NUCLEOTIDES SUCH
AS XTP TO XMP OR ITP TO IMP, BUT NOT THE STANDARD NUCLEOTIDES. XTP
IS THE BEST SUBSTRATE.
-!- CAPALYIC ACTIVITY: NTP + H(2)O = NDP + phosphate.
-!- COFACTOR: Magnesium or manganese.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SEQUENCE FROM N.A.

J. Biol. Chem. 274:18470-18476(1999).
-!- FUNCTION: RNA-editing deaminase involved in somatic hypermutation, gene conversion, and class-waitch recombination. Required for several crucial steps of B-cell terminal differentiation necessary for efficient antibody responses.
-!- CATALYTIC ACTIVITY: Cyridine + H(2)0 = uridine + NH(3).
-!- COFACTOR: Zino (By similarity).
-!- COFACTOR: Zino (By similarity).
-!- SIMILARITY: Belongs to the cytidine and deoxycytidylate deaminases

This condition causes night viation problems. It produces a typical "fundus xerophthalmicus," featuring a progressed atrophy of the retinal pigment epithelium. DISEASE: A deficiency of vitamin A blocks secretion of the binding supply of vitamin to the epidermal cells in defective delivery and supply of vitamin to the epidermal cells (a condition associated with a dermatosis).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              MEDLINE=99103495; PubMed=9888420;

Tetinol-binding proteins. 7

Lissues. In plasma, the RBP-retinol complex interacts with transthyretin, this prevents its loss by filtration through the transthyretin, this prevents its loss by filtration through the transthyretin, this prevents its loss by filtration through the complex control of subscients. 8 copyright. It is produced through a collaboration of the SWISS-PROT entry is copyright. It is produced through a collaboration of the swiss Institute of Bioinformatics and the EMBL outstation the European Bioinformatics Institute. -!- FUNCTION: REQUIRED FOR THE EXECUTION OF THE MITOTIC CHECKPOINT WHICH MONITORS THE PROCESS OF KINETOCHORE-SPINDLE ATTACHMENT AND DELAYS THE ONSET OF ANAPHASE WHEN THIS PROCESS IS NOT COMPLETE. IT INHIBITS THE ACTIVITY OF THE ANAPHASE PROMOTING COMPLETE. IT SEQUESTERING CDC20 UNTIL ALL CHROMOSOMES ARE ALIGNED AT THE METAPHASE PLATE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    MEDIINE-59458684, PubMed=10527948, Neleon K.Y., Schlondorff J., Blobel C.P., Neleon K.Y., Schlondorff J., Blobel C.P., Evidence for an interaction of the metalloprocease-disintegrin tumour necrosis factor alpha convertase (TACE) with mitotic arrest deficient 2 (MAD2), and of the metalloprocease-disintegrin MDC9 with a novel Biochem. Checkpoint protein Mad2.";

Cell 101:635-646(2000)

LICHICALON: REQUIRED FOR THE EXECUTION OF THE MITOTIC CHECKPOINT WHICH MONITORS THE PROCESS OF KINETOCHORE-SPINDLE ATTACHMENT AND DELAYS THE MONST OF ANAPHASE WHEN THIS PROCESS IS NOT COMPLETE. IT INHERTS THE ACTIVITY OF THE ANAPHASE PROMOTING COMPLEX BY SEQUESTERING CDC20 UNTIL ALL CHROMOSOMES ARE ALIGNED AT THE METAPHASE PLATE (BY SIMILARITY).

CHOUSTERING CDC20 UNTIL ALL CHROMOSOMES ARE ALIGNED AT THE METAPHASE PLATE (BY SIMILARITY).

CHOUSTERING SOUTH MAD2 FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           MEDINE=96005047; PubMed=7561763; McGarvey P.B., Tousignant M., Geletka L., Cellini F., Kaper J.M.; McGarvey P.B., Tousignant M., Geletka L., Cellini F., Kaper J.M.; The complete sequence of a cucumber mosaic virus from Ixora that is deficient in the replication of satellite RNAs."; J. Gen. Virol. 76:2257-2270 (1995).
-!- SIMILARITY: Belongs to the cucumoviruses/bromoviruses coat protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           IRON (HEME AXIAL LIGAND) (BY SIMILARITY).

5 -> K (IN REF. 1).

5 -> V (IN REF. 1).

50 -> GS (IN REF. 1).

N -> H (IN REF. 1).
FUNCTION: Allows the bacteria to use the host heme as an iron source. Involved in the oxidation of heme and subsequent release of iron from the heme moiety.

CATALYTIC ACTIVITY: Heme + 3 AH(2) + O(2) = billverdin + Fe(2+) +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            15-DEC-1998 (Rel. 37, Created)

Required for the import of protein into the nucleus and also for RNA export. Involved in chromatin condensation and control of cell cycle (By similarity).
-:- SUBUNIT: Monomer.
-:- SUBCELIULAR LOCATION: Nuclear (By similarity).
-:- SUBCELIULAR LOCATION: Nuclear (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                P412-1995 (Rel. 32, Created)

Tetrahymen thermophila.
Finkarvota; Alveolata; Ciliophora; Oligohymenophorea; Hymenostomatida;
                                                                                                                                                                                                        "V-type H+-Arpase/synthase from a thermophilic cubacterium, Thermus thermophilus. Subunit structure and operon.";
J. Biol. Chem. 275:13955-13961 (2000).
-!-FUNCTION: Produces ATP from ADP in the presence of a proton gradient across the membrane.
-!- CATALYTIC ACTIVITY: ATP + H(2)O + H(+)(In) = ADP + phosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 "Cloning of cDNAs encoding a cell-cycle-regulatory GTP-binding low-M(r) (GBLM) protein, Ran/TC4, from micronucleated Tetrahymena thermophila and amicronucleated Tetrahymena pyriformis."; Gene 144:123-125(1994).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             genome.";
Plant Mol. Biol. Rep. 13:333-335(1995).
-!- SUBUNIT: Part of the 30S ribosomal subunit.
-! SUBCELLULAR LOCATION: Chloroplast.
-!- SUBCIELLIY: Belongs to the S3P family of ribosomal proteins.
-!- SIMILARITY: Contains 1 KH type-2 domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;
